macOS

Windows

64-bit Linux

AudioMoth Time App

The AudioMoth Time App is a simple tool for setting the onboard clock of your device.

It will also display the unique ID, current battery level, firmware version and a brief description of the firmware installed on the attached AudioMoth.

Additional Linux Installation Notes

By default, Linux prevents writing to certain types of USB devices such as the AudioMoth. In order to use either of these applications you must first navigate to `/lib/udev/rules.d/` and create a new file with the name **99-audiomoth.rules**, containing the following text:

```
SUBSYSTEM=="usb", ATTRS{idVendor}=="10c4", ATTRS{idProduct}=="0002", MODE="0666"
```

If you have trouble running the **.ApplImage** executable, right click the file and ensure that it has permission to run as a program.
